

QoS Satisfaction Across Priority Classes

2D-AUTO (47 m)

Coupled-Greedy (ablation)

Strong-Coupled (deterministic)

Two-Stage (decoupled)

Equal-budget comparison: every method flies its own route until $B = 83$ kJ is spent, so energy is comparable by construction and QoS is what differs.

Paired t-test vs 2D-AUTO: *** $p < 0.001$, ** $p < 0.01$, * $p < 0.05$, n.s. not significant. Bars are mean $\pm$ Student-t 95% CI over $n = 20$ seeds.
